

Governance
Technology
Operations
Facilities

You see complex pieces to manage.

We see one proven approach.

Today's governmental public safety and campus public safety and security environments are increasingly complex. It's a difficult and time-consuming challenge to unify multiple stakeholder needs, mission critical operations, various technologies, and specialized facilities. With today's limited budgets the challenge to update these environments right the first time has never been greater.

iXP's proprietary SAIF® methodology provides a proven roadmap to address these challenges. SAIF® brings specialized knowledge and years of public safety experience to every project to ensure the integration of the four critical building blocks of public safety solutions - Governance, Operations, Technology, and Facilities.

GOVERNANCE ensures organizational alignment. The public safety and campus security environment involves many organizations and complex decision frameworks. SAIF® charts a course to navigate through this process to achieve consensus on vision, standards, procedures, interoperability, and shared resources.

OPERATIONS involves bringing the right public safety and security domain knowledge to your project. Emergency communication and security monitoring centers must function successfully on a 24/7 basis. Our approach treats your mission critical operations as the focal point of the project. We gauge all plans, designs, and implementations in relation to how well they will improve your operations. SAIF® supports

operational assessments and assists in developing standard operating procedures, best practice and process models, access control plans, and training requirements. SAIF® ensures that you will receive a robust, cost-effective, and efficient operational design the first time.

TECHNOLOGY optimizes efficiency and information availability. iXP has broad experience with public safety and security technologies. SAIF® will guide the assessment of your legacy environments and produce detailed functional and technical architectures. Our technical teams are vendor independent and will recommend the products that provide the "best fit" for meeting and exceeding your operational performance and scalability requirements.

FACILITIES support operations and provide force protection. With exposure to natural disasters and terrorist threats, facilities need to be designed with high availability and force protection in mind. Careful attention to site selection, building design, diverse connectivity, and redundant systems is required. SAIF® is the roadmap for providing the architectural support and space plan you need for implementing reliable and comfortable 24/7 work environments.

Whether your system is large or small, SAIF® provides your road to success. You get the *total* solution you desire and the long-term value you need. **Problem Solved.**
